Preface

This users guide provides documentation and examples on how to use the OpenModelica system, both for the Modelica beginners and advanced users.

Chapter 1

Introduction

The OpenModelica system described in this document has both short-term and long-term goals:

- The short-term goal is to develop an efficient interactive computational environment for the Modelica language, as well as a partial but rather complete implementation of the language. It turns out that with support of appropriate tools and libraries, Modelica is very well suited as a computational language for development and execution of both low level and high level numerical algorithms, e.g. for control system design, solving nonlinear equation systems, or to develop optimization algorithms that are applied to complex applications.
- The longer-term goal is to have a complete reference implementation of the Modelica language, including simulation of equation based models and additional facilities in the programming environment, as well as convenient facilities for research and experimentation in language design or other research activities. However, our goal is not to reach the level of performance and quality provided by current commercial Modelica environments that can handle large models requiring advanced analysis and optimization by the Modelica compiler.

The long-term *research* related goals and issues of the OpenModelica open source implementation of a Modelica environment include but are not limited to the following:

- Development of a *complete formal specification* of Modelica, including both static and dynamic semantics. Such a specification can be used to assist current and future Modelica implementers by providing a semantic reference, as a kind of reference implementation.
- Language design, e.g. to further extend the scope of the language, e.g. for use in diagnosis, structural analysis, system identification, etc., as well as modeling problems that require extensions such as partial differential equations, enlarged scope for discrete modeling and simulation, etc.
- Language design to improve abstract properties such as expressiveness, orthogonality, declarativity, reuse, configurability, architectural properties, etc.
- *Improved implementation techniques*, e.g. to enhance the performance of compiled Modelica code by generating code for parallel hardware.
- Improved debugging support for equation based languages such as Modelica, to make them even easier to use.
- Easy-to-use specialized high-level (graphical) user interfaces for certain application domains.
- Visualization and animation techniques for interpretation and presentation of results.
- Application usage and model library development by researchers in various application areas.

The OpenModelica environment provides a test bench for language design ideas that, if successful, can be submitted to the Modelica Association for consideration regarding possible inclusion in the official Modelica standard.

The current version of the OpenModelica environment allows most of the expression, algorithm, and function parts of Modelica to be executed interactively, as well as equation models and Modelica functions to be compiled into efficient C code. The generated C code is combined with a library of utility functions, a run-time library, and a

numerical DAE solver. An external function library interfacing a LAPACK subset and other basic algorithms is under development.

1.1 System Overview

The OpenModelica environment consists of several interconnected subsystems, as depicted in Figure 1-1 below.

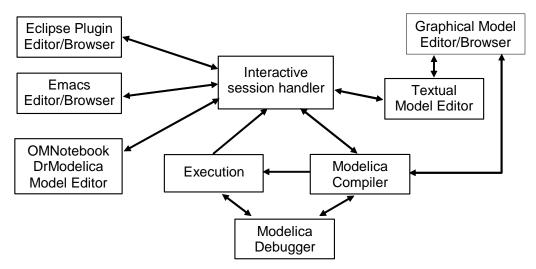

Figure 1-1. The architecture of the OpenModelica environment. Arrows denote data and control flow. The interactive session handler receives commands and shows results from evaluating commands and expressions that are translated and executed. Several subsystems provide different forms of browsing and textual editing of Modelica code. The debugger currently provides debugging of an extended algorithmic subset of Modelica. The graphical model editor is not really part of OpenModelica but integrated into the system and available from MathCore without cost for academic usage.

The following subsystems are currently integrated in the OpenModelica environment:

- An interactive session handler, that parses and interprets commands and Modelica expressions for evaluation, simulation, plotting, etc. The session handler also contains simple history facilities, and completion of file names and certain identifiers in commands.
- A Modelica compiler subsystem, translating Modelica to C code, with a symbol table containing definitions of
 classes, functions, and variables. Such definitions can be predefined, user-defined, or obtained from libraries.
 The compiler also includes a Modelica interpreter for interactive usage and constant expression evaluation.
 The subsystem also includes facilities for building simulation executables linked with selected numerical ODE
 or DAE solvers.
- An execution and run-time module. This module currently executes compiled binary code from translated
 expressions and functions, as well as simulation code from equation based models, linked with numerical
 solvers. In the near future event handling facilities will be included for the discrete and hybrid parts of the
 Modelica language.
- *Emacs textual model editor/browser*. In principle any text editor could be used. We have so far primarily employed Gnu Emacs, which has the advantage of being programmable for future extensions. A Gnu Emacs mode for Modelica has previously been developed. The Emacs mode hides Modelica graphical annotations during editing, which otherwise clutters the code and makes it hard to read. A speedbar browser menu allows to browse a Modelica file hierarchy, and among the class and type definitions in those files.

- Eclipse plugin editor/browser. The Eclipse plugin provides file and class hierarchy browsing and text editing
 capabilities, rather analogous to previously described Emacs editor/browser. Some syntax highlighting
 facilities are also included. The Eclipse framework has the advantage of making it easier to add future
 extensions such as refactoring and cross referencing support.
- OMNotebook DrModelica model editor. This subsystem provides a lightweight notebook editor, compared to
 the more advanced Mathematica notebooks available in MathModelica. This basic functionality still allows
 essentially the whole DrModelica tutorial to be handled. Hierarchical text documents with chapters and
 sections can be represented and edited, including basic formatting. Cells can contain ordinary text or Modelica
 models and expressions, which can be evaluated and simulated. However, no mathematical typesetting or
 graphic plotting facilities are yet available in the cells of this notebook editor.
- Graphical model editor/browser. This is a graphical connection editor, for component based model design by
 connecting instances of Modelica classes, and browsing Modelica model libraries for reading and picking
 component models. The graphical model editor is not really part of OpenModelica but integrated into the
 system and provided by MathCore without cost for academic usage. The graphical model editor also includes
 a textual editor for editing model class definitions, and a window for interactive Modelica command
 evaluation.
- Modelica debugger. The current implementation of debugger provides debugging for an extended algorithmic
 subset of Modelica, excluding equation-based models and some other features, but including some metaprogramming and model transformation extensions to Modelica. This is conventional full-feature debugger,
 using Emacs for displaying the source code during stepping, setting breakpoints, etc. Various back-trace and
 inspection commands are available. The debugger also includes a data-view browser for browsing hierarchical
 data such as tree- or list structures in extended Modelica.

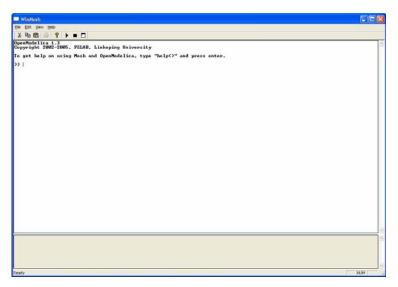

1.1.1 Implementation Status

In the current OpenModelica implementation version 1.3 (October 2005), not all subsystems are yet integrated as well as is indicated in Figure 1-1. Currently there are two versions of the Modelica compiler, one which supports most of standard Modelica including simulation, and is connected to the interactive session handler, the notebook editor, and the graphic model editor, and another meta-programming Modelica compiler version which is integrated with the debugger and Emacs, supports meta-programming Modelica extensions, but does not allow equation-based modeling and simulation. Those two versions are currently being merged into a single Modelica compiler version.

1.2 Interactive Session with Examples

The following is an interactive session using the interactive session handler in the OpenModelica environment. (Also called WinMosh.exe (under Windows) or mosh (under Linux) – the Modelica Shell).

The Windows version which at installation is made available in the start menu as OpenModelica->OpenModelica Shell responds with an interaction window:

We enter an assignment of a vector expression, created by the range construction expression 1:12, to be stored in the variable x. The value of the expression is returned.

```
>> x := 1:12
{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12}
```

Load the function bubblesort, either by using the pull-down menu File->Load Model, or by explicitly giving the command:

```
>> loadFile("C:/OpenModelica13/testmodels/bubblesort.mo")
true
```

The function bubblesort is called below to sort the vecto x in descending order. The sorted result is returned together with its type. Note that the result vector is of type Real[:], instantiated as Real[12], since this is the declared type of the function result. The input Integer vector was automatically converted to a Real vector according to the Modelica type coercion rules. The function is automatically compiled when called if this has not been done before.

```
>> bubblesort(x)
{12.0,11.0,10.0,9.0,8.0,7.0,6.0,5.0,4.0,3.0,2.0,1.0}
Another call:
>> bubblesort({4,6,2,5,8})
{8.0,6.0,5.0,4.0,2.0}
```

It is also possible to give operating system commands via the system utility function. A command is provided as a string argument. The example below shows the system utility applied to the UNIX command cat, which here outputs the contents of the file bubblesort. mo to the output stream. However, the cat command does not boldface Modelica keywords – this improvement has been done by hand for readability.

```
>> cd("C:/OpenModelical3/testmodels")
>> system("cat bubblesort.mo")

function bubblesort
   input Real[:] x;
   output Real[size(x,1)] y;
protected
   Real t;
algorithm
```

Note: Under Windows the output emitted into stdout by system commands is put into the winmosh console windows, not into the winmosh interaction windows. Thus the text emitted by the above cat command would not be returned. Only a success code (0 = success, 1 = failure) is returned to the winmosh window. For example:

```
>> system("dir")
0
>> system("Non-existing command")
1
```

Another built-in command is cd, the *change current directory* command. The resulting current directory is returned as a string.

```
>> cd()
"C:\OpenModelica13\testmodels"
>> cd("..")
"C:\OpenModelica13"
>> cd("C:\\OpenModelica13\\testmodels")
"C:\OpenModelica13\\testmodels"
```

We load a model, here the whole Modelica standard library, which also can be done through the File->Load Modelica Library menu item:

```
>> loadModel(Modelica)
true
```

We also load a file containing the demotor model:

```
>> loadFile("C:/OpenModelica13/testmodels/dcmotor.mo")
true
```

It is simulated:

```
>> simulate(dcmotor,startTime=0.0,stopTime=10.0)
record
    resultFile = "dcmotor_res.plt"
end record
```

We list the source code of the model:

```
"model dcmotor
   Modelica.Electrical.Analog.Basic.Resistor r1(R=10);
   Modelica.Electrical.Analog.Basic.Inductor i1;
   Modelica.Electrical.Analog.Basic.EMF emf1;
   Modelica.Mechanics.Rotational.Inertia load;
   Modelica.Electrical.Analog.Basic.Ground g;
   Modelica.Electrical.Analog.Sources.ConstantVoltage v;
```

```
equation
  connect(v.p,r1.p);
   connect(v.n,g.p);
  connect(r1.n,i1.p);
  connect(i1.n,emf1.p);
  connect(emf1.n,g.p);
  connect(emf1.flange b,load.flange a);
end dcmotor;
We test code instantiation of the model to flat code:
>> instantiateModel(dcmotor)
"fclass dcmotor
Real r1.v "Voltage drop between the two pins (= p.v - n.v)";
Real r1.i "Current flowing from pin p to pin n";
Real r1.p.v "Potential at the pin";
Real r1.p.i "Current flowing into the pin";
Real r1.n.v "Potential at the pin";
Real rl.n.i "Current flowing into the pin";
parameter Real r1.R = 10 "Resistance";
Real i1.v "Voltage drop between the two pins (= p.v - n.v)";
Real i1.i "Current flowing from pin p to pin n";
Real i1.p.v "Potential at the pin";
Real i1.p.i "Current flowing into the pin";
Real i1.n.v "Potential at the pin";
Real i1.n.i "Current flowing into the pin";
parameter Real i1.L = 1 "Inductance";
parameter Real emf1.k = 1 "Transformation coefficient";
Real emf1.v "Voltage drop between the two pins";
Real emf1.i "Current flowing from positive to negative pin";
Real emf1.w "Angular velocity of flange b";
Real emf1.p.v "Potential at the pin";
Real emf1.p.i "Current flowing into the pin";
Real emf1.n.v "Potential at the pin";
Real emf1.n.i "Current flowing into the pin";
Real emf1.flange b.phi "Absolute rotation angle of flange";
Real emf1.flange b.tau "Cut torque in the flange";
Real load.phi "Absolute rotation angle of component (= flange a.phi = flange b.phi)";
Real load.flange a.phi "Absolute rotation angle of flange";
Real load.flange_a.tau "Cut torque in the flange";
Real load.flange b.phi "Absolute rotation angle of flange";
Real load.flange_b.tau "Cut torque in the flange";
parameter Real load.J = 1 "Moment of inertia";
Real load.w "Absolute angular velocity of component";
Real load.a "Absolute angular acceleration of component";
Real g.p.v "Potential at the pin";
Real g.p.i "Current flowing into the pin";
Real v.v "Voltage drop between the two pins (= p.v - n.v)";
Real v.i "Current flowing from pin p to pin n";
Real v.p.v "Potential at the pin";
Real v.p.i "Current flowing into the pin";
Real v.n.v "Potential at the pin";
Real v.n.i "Current flowing into the pin";
parameter Real v.V = 1 "Value of constant voltage";
```

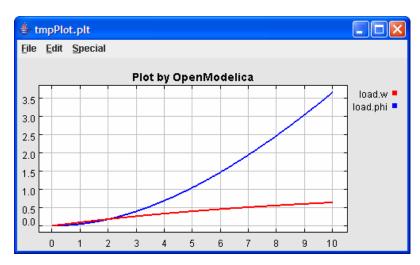

equation

r1.R * r1.i = r1.v; r1.v = r1.p.v - r1.n.v; 0.0 = r1.p.i + r1.n.i;

```
r1.i = r1.p.i;
  i1.L * der(i1.i) = i1.v;
  i1.v = i1.p.v - i1.n.v;
  0.0 = i1.p.i + i1.n.i;
  i1.i = i1.p.i;
  emf1.v = emf1.p.v - emf1.n.v;
  0.0 = emf1.p.i + emf1.n.i;
  emf1.i = emf1.p.i;
  emf1.w = der(emf1.flange_b.phi);
  emf1.k * emf1.w = emf1.v;
  emf1.flange_b.tau = -(emf1.k * emf1.i);
  load.w = der(load.phi);
  load.a = der(load.w);
  load.J * load.a = load.flange_a.tau + load.flange_b.tau;
  load.flange_a.phi = load.phi;
  load.flange_b.phi = load.phi;
  g.p.v = 0.0;
  v.v = v.V;
  v.v = v.p.v - v.n.v;
  0.0 = v.p.i + v.n.i;
  v.i = v.p.i;
  emf1.flange_b.tau + load.flange_a.tau = 0.0;
  emf1.flange_b.phi = load.flange_a.phi;
  emf1.n.i + v.n.i + g.p.i = 0.0;
  emf1.n.v = v.n.v;
  v.n.v = g.p.v;
  i1.n.i + emf1.p.i = 0.0;
  i1.n.v = emf1.p.v;
  r1.n.i + i1.p.i = 0.0;
  r1.n.v = i1.p.v;
  v.p.i + r1.p.i = 0.0;
  v.p.v = r1.p.v;
  load.flange_b.tau = 0.0;
end dcmotor;
```

We plot part of the simulated result:

```
>> plot({load.w,load.phi})
true
```

We load and simulate the BouncingBall example containing when-equations and if-expressions (the Modelica keywords have been bold-faced by hand for better readability):

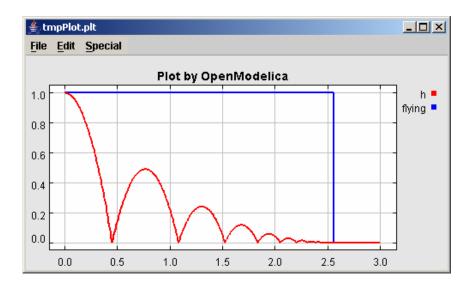

```
>> loadFile("C:/OpenModelica13/testmodels/BouncingBall.mo")
true
>> list(BouncingBall)
"model BouncingBall
  parameter Real e=0.7 "coefficient of restitution";
 parameter Real g=9.81 "gravity acceleration";
 Real h(start=1) "height of ball";
  Real v "velocity of ball";
 Boolean flying(start=true) "true, if ball is flying";
 Boolean impact;
 Real v_new;
equation
  impact=h <= 0.0;
  der(v)=if flying then -g else 0;
  der(h) = v;
  when \{h \le 0.0 \text{ and } v \le 0.0, \text{impact}\} then
    v_new=if edge(impact) then -e*pre(v) else 0;
    flying=v_new > 0;
    reinit(v, v_new);
  end when;
end BouncingBall;
```

Instead of just giving a simulate and plot command, we perform a runScript command on a .mos (Modelica script) file sim BouncingBall.mos that contains these commands:

```
loadFile("BouncingBall.mo");
simulate(BouncingBall, stopTime=3.0);
plot({h,flying});
```

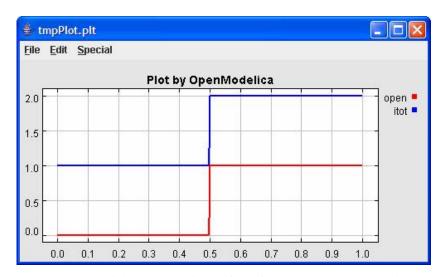

The runScript command:

```
>> runScript("sim_BouncingBall.mos")
"true
record
    resultFile = "BouncingBall_res.plt"
end record
true
true"
```

We enter a switch model, to test if-equations (e.g. copy and paste from another file and push enter):

```
>> model switch
  Real v;
  Real i;
  Real i1;
  Real itot;
 Boolean open;
equation
  itot = i + i1;
  if open then
   v = 0;
  else
   i = 0;
  end if;
  1 - i1 = 0;
  1 - v - i = 0;
  open = time >= 0.5;
end switch;
>> simulate(switch, startTime=0, stopTime=1);
>> plot({itot,open})
true
```

We note that the variable open switches from false (0) to true (1), causing itot to increase from 1.0 to 2.0.

Now, clear all loaded libraries and models:

```
>> clear()
true
```

List the loaded models – but nothing left:

```
>> list()
```

We load another model, the VanDerPol model (or via the menu File->Load Model):

```
>> loadFile("C:/OpenModelica13/testmodels/VanDerPol.mo"))
```

```
true
It is simulated:
 >> simulate(VanDerPol)
 record
      resultFile = "VanDerPol res.plt"
 end record
Assign a vector to a variable:
 >> a:=1:5
 {1,2,3,4,5}
Type in a function:
 >> function MySqr input Real x; output Real y; algorithm y:=x*x; end MySqr;
Call the function:
 >> b:=MySqr(2)
 4.0
Look at the value of variable a:
 >> a
 {1,2,3,4,5}
Look at the type of a:
 >> typeOf(a)
 "Integer[]"
Retrieve the type of b:
 >> typeOf(b)
 "Real"
What is the type of MySqr? Cannot currently be handled.
 >> typeOf(MySqr)
 Error evaluating expr.
List the available variables:
 >> listVariables()
 {currentSimulationResult, a, b}
```

Do code instantiation to flat forrm of the VanDerPol model:

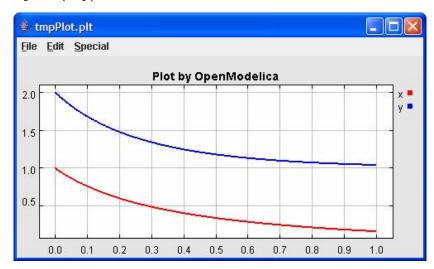

```
>> instantiateModel(VanDerPol)
"fclass VanDerPol
Real x(start=1.0);
Real y(start=1.0);
parameter Real lambda = 0.3;
equation
  der(x) = y;
  der(y) = -x + lambda * (1.0 - x * x) * y;
end VanDerPol;
"
Clear again:
```

```
>> clear()
true
```

The following is a small example (ExternalLibraries.mo) to show the use of external functions:

```
model ExternalLibraries
   Real x(start=1.0), y(start=2.0);
 equation
   der(x) = -ExternalFunc1(x);
   der(y) = -ExternalFunc2(y);
 end ExternalLibraries;
 function ExternalFunc1
   input Real x;
   output Real y;
 external
  y=ExternalFunc1 ext(x) annotation(Library="libExternalFunc1 ext.o",
                                       Include="#include \"ExternalFunc1 ext.h\"");
 end ExternalFunc1;
 function ExternalFunc2
   input Real x;
   output Real y;
   external "C" annotation(Library="libExternalFunc2.a",
                            Include="#include \"ExternalFunc2.h\"");
 end ExternalFunc2;
These C (.c) files and header files (.h) are needed:
 /* file: ExternalFunc1.c */
 double ExternalFunc1_ext(double x)
   double res;
  res = x+2.0*x*x;
   return res;
 /* Header file ExternalFunc1_ext.h for ExternalFunc1 function */
 double ExternalFunc1_ext(double);
 /* file: ExternalFunc2.c */
 double ExternalFunc2(double x)
   double res;
   res = (x-1.0)*(x+2.0);
   return res;
 /* Header file ExternalFunc2.h for ExternalFunc2 */
 double ExternalFunc2(double);
The following script file ExternalLibraries.mos will perform everything that is needed, provided you have gcc
installed in your path:
 loadFile("ExternalLibraries.mo");
 system("gcc -c -o libExternalFunc1_ext.o ExternalFunc1.c");
 system("gcc -c -o libExternalFunc2.a ExternalFunc2.c");
 simulate(ExternalLibraries);
We run the script:
 >> runScript("ExternalLibraries.mos");
and plot the results:
```

Leave and quit OpenModelica:

>> quit()

list()

1.3 Commands for the Interactive Session Handler

The following is the complete list of commands currently available in the interactive session hander.

simulate (modelname) Translate a model named modelname and simulate it.

simulate(modelname[,startTime=<Real>][,stopTime=<Real>][,numberOfIntervals

=<Integer>]) Translate and simulate a model, with optional start time, stop time, and optional number of simulation intervals or steps for which the simulation results will be computed. Many steps will give higher time resolution, but occupy more space and take longer to compute. The default number of intervals is 500.

plot (vars) Plot the variables given as a vector or a scalar, e.g. plot ($\{x1, x2\}$) or plot (x1).

cd() Return the current directory.

cd(dir) Change directory to the directory given as string.

clear() Clear all loaded definitions.
clearVariables() Clear all defined variables.

instantiateModel (*modelname*) Performs code instantiation of a model/class and return a string containing the flat class definition.

Return a string containing all loaded class definitions.

list(modelname)
Return a string containing the class definition of the named class.

Return a vector of the names of the currently defined variables.

Load model or package of name classname from MODELICAPATH.

Load Modelica file (.mo) with name given as string argument str.

readFile (str) Load file given as string str and return a string containing the file content.

runScript (str) Execute script file with file name given as string argument str.

system(str) Execute str as a system(shell) command in the operating system; return integer

success value. Output into stdout from a shell command is put into the console

window.

timing (expr) Evaluate expression expr and return the number of seconds (elapsed time) the

evaluation took.

typeOf (variable) Return the type of the variable as a string.

saveModel (str, modelname) Save the model/class with name modelname in the file given by the string argument

str.

help() Print this helptext (returned as a string).

quit () Leave and quit the OpenModelica environment

Chapter 2

Getting Started with the Graphical Model Editor

This chapter gives a short introduction to graphical modeling. You will learn how to build your own model using the graphical model editor by using the drag-and-drop technique of already developed and freely available components from the Modelica Standard Library.

NOTE: This chapter is a preliminary description which in the near future will be replaced by a separate manual for the Graphical Model Editor.

The Modelica Standard Library is loaded into the OpenModelica environment when the model editor is started and can be browsed using the class browser visible at the left of Figure 2-1 below.

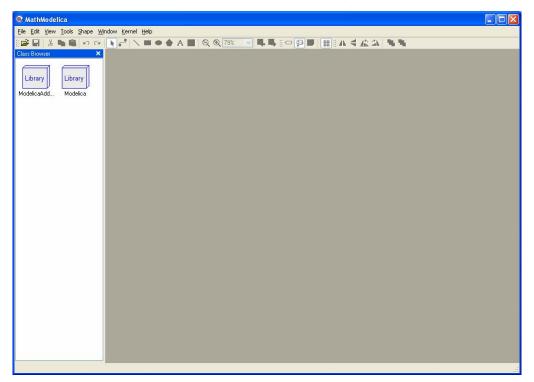

Figure 2-1. The Graphical Model Editor with the class browser to the left, showing icons for the ModelicaAdditions library and the Modelica Standard library.

To open the library, double click on the Modelica package icon in the class browser to the left. As shown by Figure 2-2, the Modelica Standard Library is hierarchically structured into sublibraries.

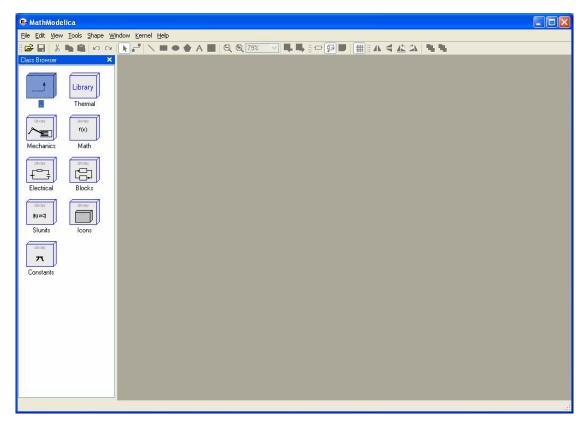

Figure 2-2. The Graphical Model Editor with the class browser showing the Modelica Standard library opened up into sublibraries.

The following list briefly describes the most important sublibraries in the Modelica standard library:

Thermal Components for thermal systems.

Mechanica Mechanical rotational and translational components.

Math Definitions of common mathematical functions, such as sin, cos, and log.

Electrical Common electrical components, such as resistors and transistors.

Blocks Continuous and discrete input/output blocks for use in block diagrams.

SIunits Type definitions with SI standard names and units.

Icons Graphical layout for many component icons

Constants Common constants from mathematics, physics, etc.

2.1 Your First Model

We will introduce the model editor by showing how to build a model of a simple DC motor. Since the DC motor includes both electrical and rotational mechanical components the example also illustrates multi-domain modeling.

2.1.1 Creating a New Model

To create a new model, select New Model in the File menu. A dialog box will appear, in which you will be able to specify a name of the new model. Enter Motor as Model name.

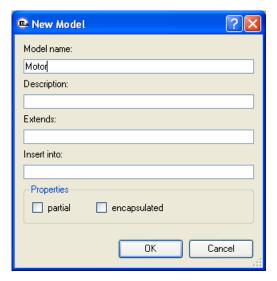

Figure 2-3. Dialog box for creating a new model.

When clicking on the OK button of the dialog box a new window will appear. This window presents different views of the model. A model has two graphical views (Icon and Diagram), and one text view (ModelicaText).

Your new Motor model will also appear at the top package level in the class browser. Since no icon for the model has yet been created it is assigned a default icon (a question mark).

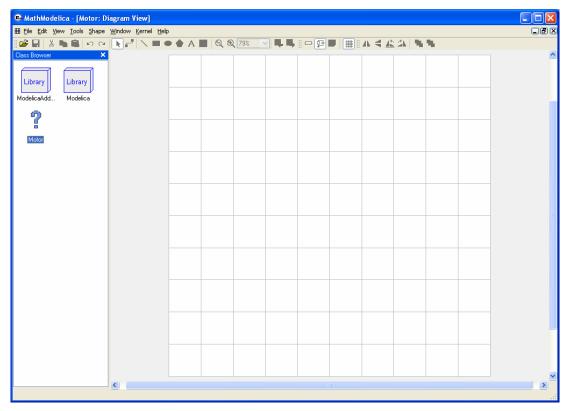

Figure 2-4. The Graphical Model Editor with the new Motor model appearing as a question mark icon in the class browser window to the left.

Now you can assemble the DC motor by drag-and-drop of components from the class browser to the diagram view window to the right. The constant voltage source component can be found in the Modelica.Electrical.Analog.Sources package whereas the rotational mass representing the motor shaft is located in the Modelica.Mechanics.Rotational package. The other electrical components needed are located in the Modelica.Electrical.Analog.Basic package.

Components placed in the diagram layer window can be graphically transformed using the mouse and keyboard. To move a component, select it and hold down the left mouse button while moving the mouse. The component will follow the mouse cursor. Release the mouse button when the component is located at the desired position. If more than one component is selected, all of them will be moved simultaneously.

Scaling of components is done using the handles that are visible when a component is selected. Place the mouse cursor over one of the handles, click and hold down the left mouse button while moving the mouse.

Components can also be rotated freely using the handles visible when a component is selected. Place the mouse cursor over one of the handles, click and hold down the left mouse button and the shift button on the keyboard while moving the mouse. The mouse cursor will change its appearance while rotating the component.

Pressing the right mouse button when the mouse cursor is placed over a component brings up a menu with suitable operations.

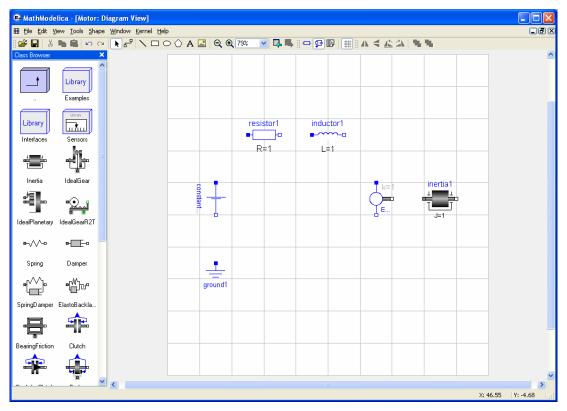

Figure 2-5. The Graphical Model Editor with several components dragged into the diagram view, and several sublibraries and model classes visible in the class browser window to the left.

When the components have been placed on the drawing area, similar to the figure above, you have to draw the lines that connect the components. This is done using the connector tool from the toolbar:

To connect two components, select the connector tool and place the mouse cursor over a connector, i.e., the square symbol on either side of the component. When you are close enough, the mouse cursor will change into a cross. Click and a hold down the left mouse button, drag the cursor to the other connector and then release the mouse button when the mouse cursor turns into a cross. Continue to connect all components until the model diagram resembles the one in Figure 2-6 below.

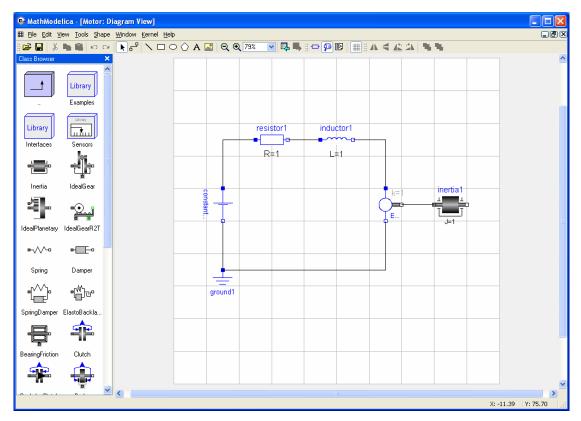

Figure 2-6. The Graphic Model Editor with components connected into a simple DC motor model.

2.1.2 Changing Parameter Values of Components

To change a parameter value of a component, e.g. the resistance of the resistor, we need to switch to the Modelica Text View of the class. Click on the Modelica Text View button in the toolbar to switch to text mode:

Whenever we switch from the graphical view to the Modelica Text View after making any changes to the model in the graphical layers we need to update the text view. Click on the Refresh Class button, also found in the toolbar:

After the text view has been updated it should look similar to the one in Figure 2-7. The order of the component declarations and connection equations depend on in which order you placed them on the drawing area and connected them.

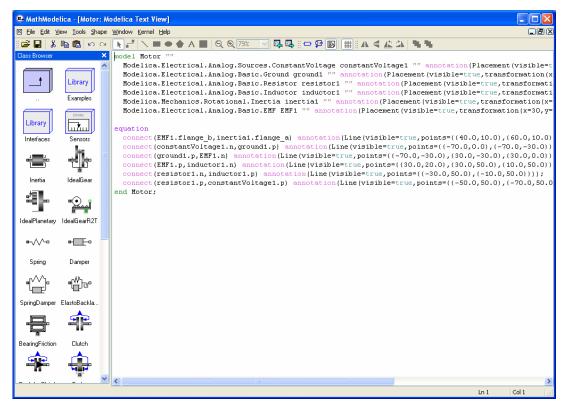

Figure 2-7. The Graphical Model Editor with the Modelica Text View mode showing the new Motor model. This view also allows text editing of the model.

Locate the line that starts with Modelica.Electrical.Analog.Basic.Resistor. Put the text cursor right after resistor1 and add the text (R=20). This text is a modification of the resistor component, changing its parameter R (resistance) from the default value of 1 to 20. The Modelica Text View should now look similar to the one found in Figure 2-8 below.

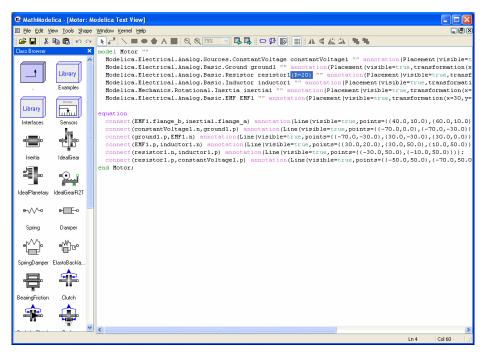

Figure 2-8. The Modelica Text View of the Motor model, with a modifier R=20 added for the resistor1 component.

When you make any changes to the model in the Modelica Text View you need to click on the Apply Class Definition button in the toolbar to confirm the changes:

When you have done this, change class view back to the Diagram View and study the icon of the resistor component. It should show R=20 instead of R=1, i.e., the resistance of the resistor is now 20 ohm.

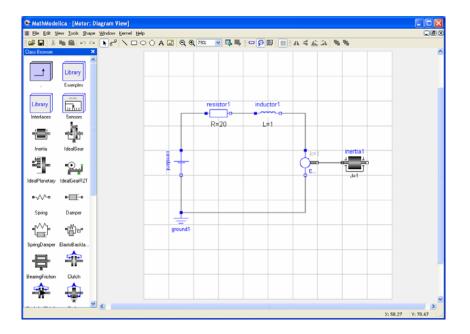

Figure 2-9. The Diagram View showing R=20 for the resistor1 component.

2.1.3 Translating and Simulating Using the Interactive View

Translating and simulating is performed using the Interactive View of the simulation kernel window. To open the kernel window, select Open Kernel Window in the File menu. Enter the command simulate (Motor) in the interactive view to translate and simulate the model.

```
Interactive View

simulate (Motor)
record
resultFile = "Motor_res.plt"

end record
```

Figure 2-10. The interactive view of the simulation kernel window, with the simulation command simulate (Motor).

2.1.4 Plotting

After the model has been translated and simulated, any of its variables can be plotted using the plot command. Giving the command plot ({inductor1.w, inertia1.a}) will bring up the window below.

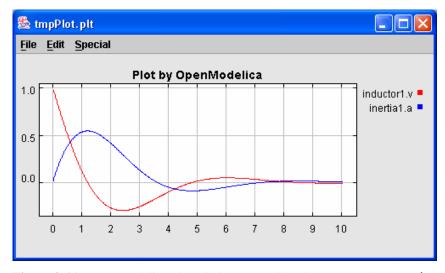

Figure 2-11. OpenModelica plot window created by the command: plot({inductor1.w, inertia1.a}), after a simulation of the Motor model.

2.1.5 Saving and Loading

It is possible to save a model from the model editor. Saving a model will create a Modelica 2.0 standard output file with the extension .mo. This file can later be loaded back into the model editor.

2.2 Keyboard Command Shortcuts

The following are keyboard shortcut commands available in the different windows of the Graphical model editor, including the text editing window.

2.2.1 Class Window – Common Shortcuts

CTRL + O Open a Modelica (.mo) file.

CTRL + Q Quit the model editor.

2.2.2 Class Browser Window

LEFT ARROW Select the class to the left of the currently selected class.

RIGHT ARROW Select the class to the right of the currently selected class.

UP ARROW Select the class above the currently selected class.

DOWN ARROW Select the class below the currently selected class.

ENTER If the selected class is a package; open the package and view its contents, otherwise; open

the class for editing.

DELETE Delete the selected class.

2.2.3 Class Window – Graphical Layer View

CTRL + S

Save class present in active class window.

CTRL + Z

Undo last undo/redo supported operation.

CTRL + Y

Redo last undo/redo supported operation.

Zoom In tool.

CTRL + A Select all items.

Delete the selected items.

CTRL + W Zoom the view to fit the size of the window.

Switch to a full screen view of the graphical layer.

Deselect all items, or if the Full Screen view is activated, return to normal view.

Pointer tool. SPACE Connector tool. C Line tool. L Rectangle tool. R Ellipse tool. Ε Polygon tool. Ρ Т Text tool. Bitmap tool. В

- Zoom Out tool.

Move selected items left, otherwise if no selection move view area left.

Move selected items right, otherwise if no selection move view area right.

Move selected items up, otherwise if no selection move view area up.

DOWN ARROW Move selected items down, otherwise if no selection move view area down.

CTRL + LEFT ARROW Move view area to the left end of the diagram.

CTRL + RIGHT ARROW Move view area to the right end of the diagram.

CTRL + UP ARROW Move view area to the top of the diagram.

CTRL + DOWN ARROW Move view area to the bottom of the diagram.

SHIFT + LEFT ARROW Small move of selected items left; if no selection move view area left.

SHIFT + RIGHT ARROW Small move of selected items right; if no selection move view area right.

SHIFT + UP ARROW Small move of selected items up; if no selection move view area up.

SHIFT + DOWN ARROW Small move of selected items down; if no selection move view area down.

PAGE UP Move view area up.

PAGE DOWN Move view area down.

SHIFT + PAGE UP Move view area left.

SHIFT + PAGE DOWN Move view area right.

Move view area to the upper left corner.

Move view area to the lower left corner.

CTRL + HOME Move view area to the upper right corner.

CTRL + END Move view area to the lower right corner.

CTRL + L Rotate the selected items 90° to the left (anti-clockwise).

CTRL + R Rotate the selected items 90° to the right (clockwise).

CTRL + H Flip the selected items horizontally.

CTRL + J Flip the selected items vertically.

2.2.4 Class Window – Modelica Text View

CTRL + P Print the text.

CTRL + A Select all text.

CTRL + Z Undo last edit.

CTRL + Y Redo last edit.

CTRL + X

Cut the selected text to the Clipboard.

CTRL + C

COPY the selected text to the Clipboard.

CTRL + V

Paste Clipboard contents into the text editor.

LEFT ARROW Move one character left.

RIGHT ARROW Move one character right.

UP ARROW Move one line up.

DOWN ARROW Move one line down.

PAGE UP Move one page up.
PAGE DOWN Move one page up.

HOME Move to the beginning of the line.

END Move to the end of the line.

CTRL + HOME Move to the beginning of the text.

CTRL + END Move to the end of the text.

Delete the selected text, or if no text is selected, delete the character to the right.

2.2.5 Interative Kernel Window – Output View

CTRL + C Copy the selected text to the Clipboard.

CTRL + A Select all text.

2.2.6 Interactive Kernel Window – Input Field

CTRL + X Cut the selected text to the Clipboard.

CTRL + C Copy the selected text to the Clipboard.

CTRL + V Paste Clipboard contents into the text field.

CTRL + Z Undo the last operation.

CTRL + Y Redo the last operation.

Delete the selected text, or if no text is selected, delete the character to the right.

CTRL + A Select all text.

ENTER Evaluate given command.

UP ARROW Step backward in the history of commands.

DOWN ARROW Step forward in the history of commands.

Chapter 3

DrModelica Notebook and Model Editor

This chapter covers the OpenModelica electronic notebook and model editor subsystem, together with the DrModelica tutoring system for teaching Modelica, which is based on such notebooks.

However, the OpenModelica notebook facility is work in progress, which currently is only partially completed (see Section 0). For these reasons we first present the electronic notebook facility and DrModelica based on the MathModelica implementation. The OpenModelica electronic notebooks is a simplified version of those notebooks, that however still are able to handle the full DrModelica system.

3.1 Interactive Notebooks with Literate Programming

Interactive Electronic Notebooks are active documents that may contain technical computations and text, as well as graphics. Hence, these documents are suitable to be used for teaching and experimentation, simulation scripting, model documentation and storage, etc.

The Notebook facility is actually an interactive WYSIWYG (What-You-See-Is-What-You-Get) realization of Literate Programming, a form of programming where programs are integrated with documentation in the same document.

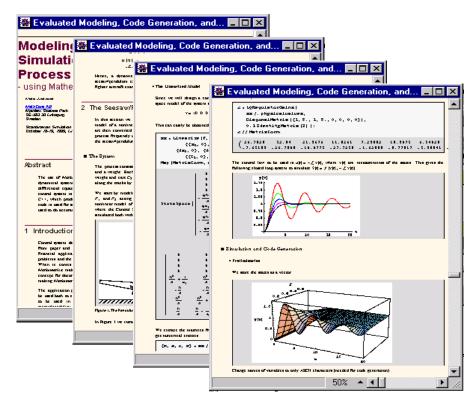

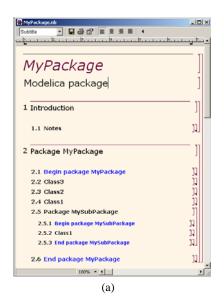

Figure 3-1. Examples of notebooks in the MathModelica modeling and simulation environment.

3.1.1 Tree Structured Hierarchical Document Representation

Traditional documents, e.g. books and reports, essentially always have a hierarchical structure. They are divided into sections, subsections, paragraphs, etc. Both the document itself and its sections usually have headings as labels for easier navigation. This kind of structure is also reflected in electronic notebooks. Every notebook corresponds to one document (one file) and contains a tree structure of cells. A cell can have different kinds of contents, and can even contain other cells. The notebook hierarchy of cells thus reflects the hierarchy of sections and subsections in a traditional document such as a book.

```
package MyPackage
  model class3
    ...
  end class3;
  model class2 ...
  model class1 ...
  package MySubPackage
    model class1
    ...
  end class1;
  end MySubPackage;
end MyPackage;
```

Figure 3-2. The package MyPackage in a notebook (a) and as Modelica text (b).

Modelica packages including documentation and test cases can also be stored as notebooks, e.g. as in Figure 3-1 or Figure 3-2. Those cells that contain Modelica model classes intended to be used from other models, e.g. library components or certain application models, can be marked as Modelica code cells. This means that it is possible to export the Modelica cells in the notebook MyPackage.nb of Figure 3-2a, into a file MyPackage.mo with the contents shown in Figure 3-2b.

3.2 The DrModelica Tutoring System

Understanding programs is hard, especially code written by someone else. For educational purposes it is essential to be able to show the source code and to give an explanation of it at the same time.

Moreover, it is important to show the result of the source code's execution. In modeling and simulation it is also important to have the source code, the documentation about the source code, the execution results of the simulation model, and the documentation of the simulation results in the same document. The reason is that the problem solving process in computational simulation is an iterative process that often requires a modification of the original mathematical model and its software implementation after the interpretation and validation of the computed results corresponding to an initial model.

Most of the environments associated with equation-based modeling languages focus more on providing efficient numerical algorithms rather than giving attention to the aspects that should facilitate the learning and teaching of the language. There is a need for an environment facilitating the learning and understanding of Modelica. These are the reasons for developing the DrModelica teaching material for Modelica and for teaching modeling and simulation.

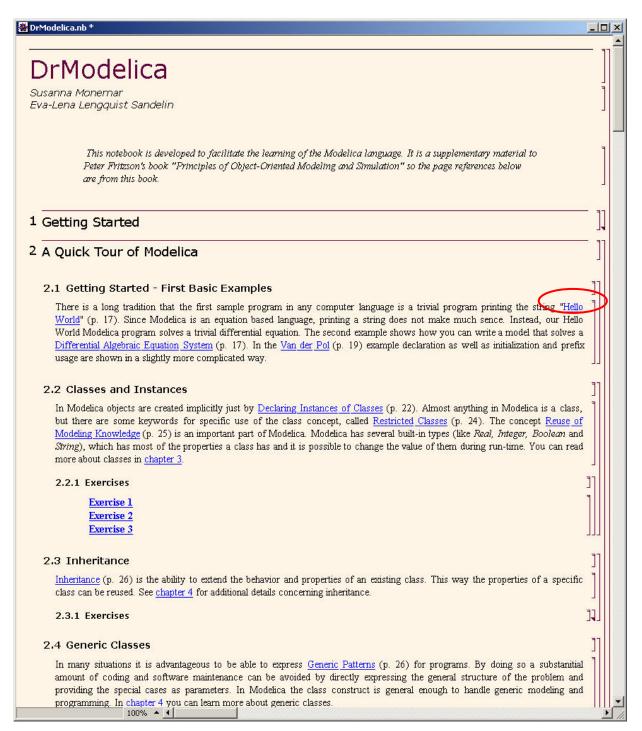

Figure 3-3. The front-page notebook of the DrModelica tutoring system.

DrModelica has a hierarchical structure represented as notebooks. The front-page notebook is similar to a table of contents that holds all other notebooks together by providing links to them. This particular notebook is the first page the user will see (Figure 3-3).

In each chapter of DrModelica the user is presented a short summary of the corresponding chapter of the book "Principles of Object-Oriented Modeling and Simulation with Modelica 2.1" by Peter Fritzson. The summary introduces some *keywords*, being hyperlinks that will lead the user to other notebooks describing the keywords in detail.

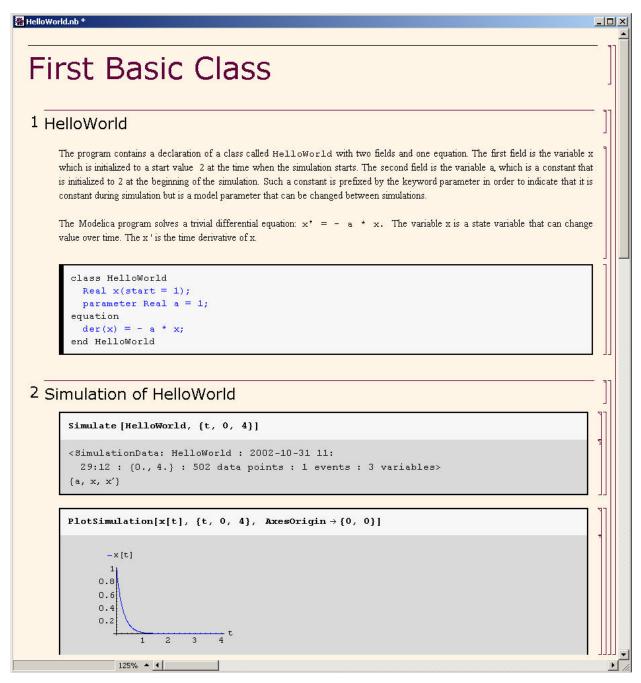

Figure 3-4. The HelloWorld class simulated and plotted using the MathModelica version of DrModelica.

Now, let us consider that the link "HelloWorld" in DrModelica Section 2.1 in Error! Reference source not found. is clicked by the user. The new notebook, to which the user is being linked (see Figure 3-4), is not only a textual

description but also contains one or more examples explaining the specific keyword. In this class, Helloworld, a differential equation is specified.

No information in a notebook is fixed, which implies that the user can add, change, or remove anything in a notebook. Alternatively, the user can create an entirely new notebook in order to write his/her own programs or copy examples from other notebooks. This new notebook can be linked from existing notebooks.

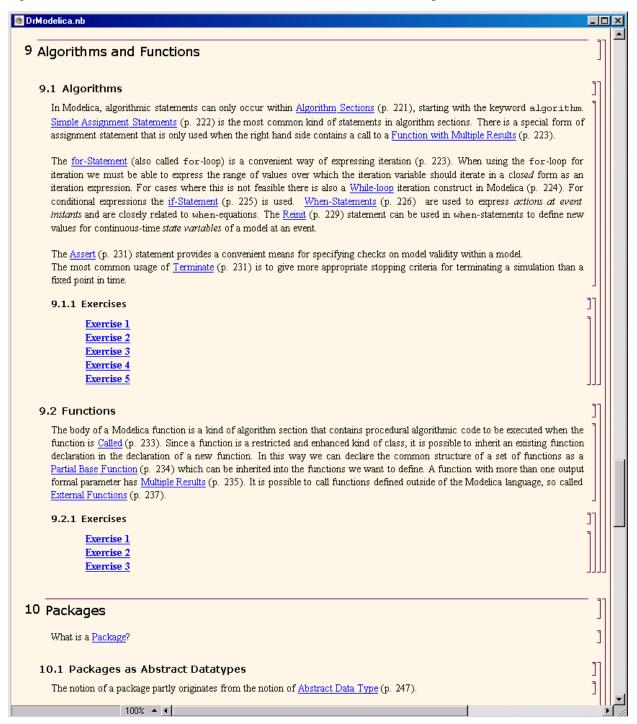

Figure 3-5. DrModelica Chapter 9 in the main page of the MathModelica version of DrModelica.

When a class has been successfully evaluated the user can simulate and plot the result, as depicted in Figure 3-4 for the simple HelloWorld example model..

After reading a chapter in DrModelica the user can immediately practice the newly acquired information by doing the exercises that concern the specific chapter. Exercises have been written in order to elucidate language constructs step by step based on the pedagogical assumption that a student learns better "using the strategy of learning by doing". The exercises consist of either theoretical questions or practical programming assignments. All exercises provide answers in order to give the user immediate feedback.

Figure 3-5 shows Chapter 9 of the DrModelica teaching material. Here the user can read about language constructs, like algorithm sections, when-statements, and reinit equations, and then practice these constructs by solving the exercises corresponding to the recently studied section.

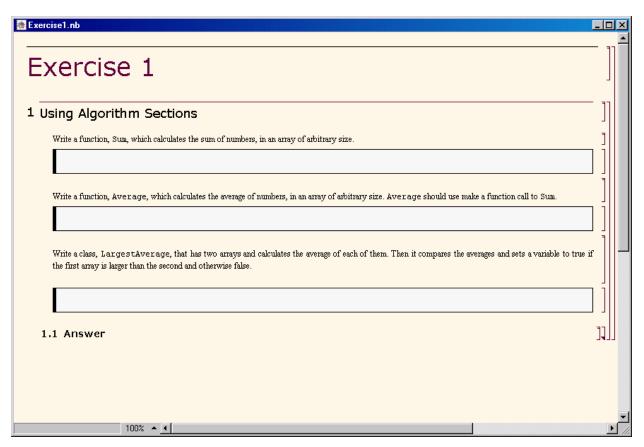

Figure 3-6. Exercise 1 in Chapter 9 of DrModelica.

Exercise 1 in Section 9.1.1 is shown in Figure 3-6. In this exercise the user has the opportunity to practice different language constructs and then compare the solution to the answer for the exercise. Notice that the answer is not visible until the *Answer* section is expanded. The answer is shown in Figure 3-7.

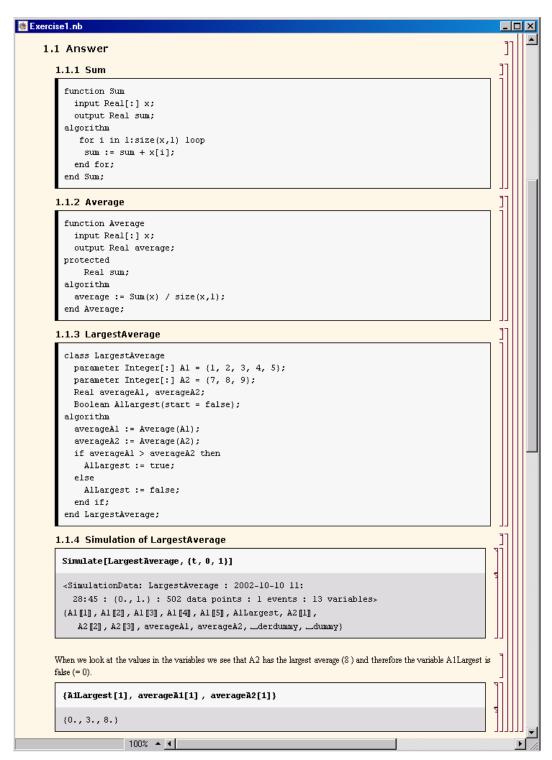

Figure 3-7. The answer section to Exercise 1 in Chapter 9 of DrModelica.

3.3 Using OpenModelica Notebooks on DrModelica

As mentioned in the introduction to this chapter, the OpenModelica notebook facility (OMNotebook) is a simplified implementation of the basic electronic notebook facilities, but advanced enough to represent hierarchical documents, simple type setting, text editing, etc., which is enough to be able to read in the whole DrModelica teaching material.

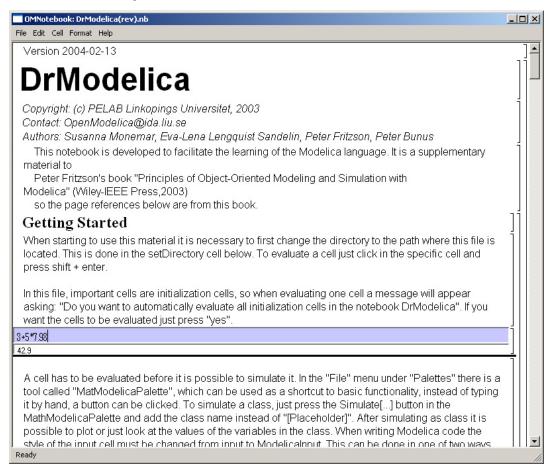

Figure 3-8. The start page (main page) of DrModelica in the OpenModelica notebook system.

This is exemplified by Figure 3-8, showing the DrModelica main page (start page) in the teaching material.

As can be seen from Figure 3-9 and Figure 3-10, the OpenModelica notebook implementation can already represent the hierarchical structure of documents, cells, etc., but lacks some polishing in terms of formatting and available commands. Also, no graphic information can currently be represented.

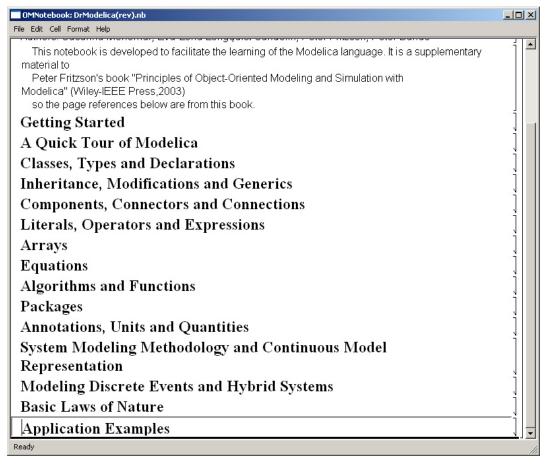

Figure 3-9. The DrModelica main notebook in OpenModelica with most cells closed, only showing the title of each cell, thus creating a form of table-of-contents for the notebook.

Figure 3-9 shows the main notebook of DrModelica will all cells closed, only showing the heading of each cell/section. This looks like a kind of table-of-contents, which is convenient for navigation in the notebook. To read a closed section, just click on it and it will open.

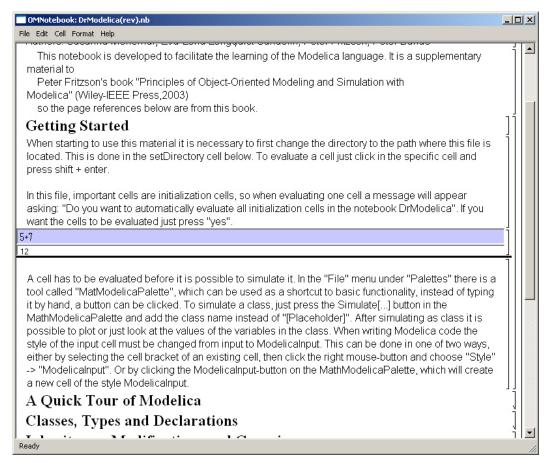

Figure 3-10. The OpenModelica DrModelica notebook, showing the evaluation of a simple expression (5+7) in a cell in the middle, followed by the creation of an output cell to contain the result: 12..

The OpenModelica Notebook facility is coupled to the OpenModelica compiler and simulator, thus allowing evaluation of expressions, simulation of models, and interactive session commands as specified in Section 1.3.

3.4 OpenModelica Notebook Commands

The current prototype (2005-05-11) of OpenModelica notebooks support the following operations:

- Opening and closing groups of cells by double clicking the hierarchical tree view (to the right).
- Evaluation of Modelica code, commands, and expressions in input cells by typing SHIFT+RETURN. The evaluation results are shown in a created output cell.
- Opening and loading notebook files stored in XML-format (Command: CTRL+O, Menu: File > Open).
- Opening and loading notebook files stored in FullForm Mathematica notebook format (Command: CTRL+O, Menu: File > Open).
- Saving notebook files in XML format (Command: CTRL+S, Menu: File > Open or File > Save As).
- Close current document (Command: CTRL+W or ALT+F4, Menu: File > Close).
- Terminating the notebook subsystem (Command: ALT+Q, Menu: File > Quit).
- Select a cell, by a single click on the cell in the tree view to the right.

- Select more cells by a single click on the cell in the tree view to the right and holding CTRL pressed down.
- Possibility to edit the style template to change the appearance of different cell types. This is done by editing the file stylesheet.xml.
- Move cursor, by CTRL + UP ARROW or CTRL + DOWN ARROW, or Menu: Cell > Next Cell or Cell > Privous Cell.
- Select and copy text inside a cell.
- Color marking and indentation of Modelica code.
- Show how text is stored inside a cell, by menu Edit -> View Expression.
- Add a new cell (Command: CTRL+A, Menu: Cell > Add).
- Create a input cell for openmodelica code (Command: CTRL+SHIFT+I, Menu: Format > Input cell).
- Undo on text changes inside a cell (Command: CTRL+Z).
- Create a group cell around the cell selected by the cursor (Command: CTRL+SHIFT+G, Menu: Format > Group cell).
- Remove selected cell/cells (Command: CTRL+SHIFT+D, Menu: Cell > Delete).
- Cut selected cell/cells (Command: CTRL+SHIFT+X, Menu: Cell > Cut Cell).
- Copy selected cell/cells (Command: CTRL+SHIFT+C, Menu: Cell > Copy Cell).
- Paste cut or copyed cell/cells (Command: CTRL+SHIFT+V, Menu: Cell > Paste Cell).
- Change text style for a cell, with menu Format -> Styles -> (select style).
- Clickable active links that opens the linked document when clicked on the link. Links can only be opend if the cell containing the link is not selected.

The following functionality is ongoing work and is currently being implemented:

- Add own links to the text.
- Moving a cell by dragging it in the tree view.
- Pasting graphic images into special graphic cells.
- Display ploted images in special graphic cells.
- Change text settings on individual words and letters.
- Export document text to pure text form with no structure saved.
- Undo/Redo for cell changes.
- Search and replace functions.
- Print function.
- Change between different stylesheets at runtime.
- Change syntax highlighting colors at runtime.
- Magnification on the document.
- Convert the cell type from one type to another type.

Chapter 4

Emacs Textual Model Editor/Browser

The Emacs Modelica mode provides facilities for keyword highlighting, suppressing annotations, etc.

(?? Need to describe those facilities, including how the Modelica mode is started).

Another quite useful facility is the Speedbar menu, depicted in Figure 4-1. (?? This Screendump shows the same facility used for RML code, not Modelica code. Needs to be updated)

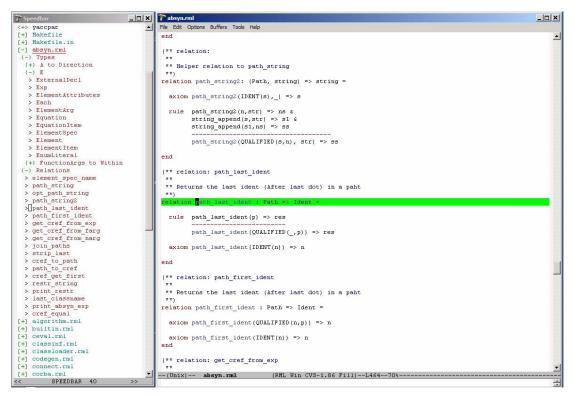

Figure 4-1. Emacs with a speedbar menu to the left, which allows clicking on file names (for expansion or closing the file contents menu). An expanded file shows all function, class, and type declarations. By clicking on one of those, you can position the editor at the appropriate definition.

Give the command M-x speedbar to start the Speedbar menu. See Section 6.1 for an explanation to the notation M-x, etc.

When you open files the speedbar menu will automatically update itself. You can double-click with the left mouse button or single-click with the middle button to expand trees, and jump between files and program definitions. At the top you see the search path to the current directory, where you can click on the directory names at different levels to jump back and forth in the hierarchy. Subdirectories are visible in the tree as expandable nodes.

It is also possible to right-click in the speedbar window to have a menu appear.

Chapter 5

MDT – The OpenModelica Development Tooling Eclipse Plugin

5.1 Introduction

The Modelica Development Tooling (MDT) Eclipse Plug-In integrates the OpenModelica compiler with Eclipse. MDT, together with the OpenModelica compiler, provides an environment for working with Modelica development projects.

The following features are available:

- Browsing support for Modelica projects, packages, and classes
- Wizards for creating Modelica projects, packages, and classes
- Syntax color highlighting
- Syntax checking
- Browsing of the Modelica Standard Library

5.2 Installation

The installation of MDT is accomplished by following the below installation instructions. These instructions assume that you have successfully downloaded and installed Eclipse (http://www.eclipse.org).

- 1. Start Eclipse
- 2. Select Help -> Software Updates -> Find and Install... from the menu
- 3. Select 'Search for new features to install' and click 'Next'
- 4. Select 'New Remote Site...'
- 5. Enter 'MDT' as name and 'http://www.ida.liu.se/labs/pelab/OpenModelica/MDT as URL and click 'OK'
- 6. Make sure 'MDT' is selected and click 'Finish'
- 7. In the updates dialog select the 'MDT' feature and click 'Next'
- 8. Read through the license agreement, select 'I accept...' and click 'Next'
- 9. Click 'Finish' to install MDT

5.3 Getting started

5.3.1 Configuring the OpenModelica Compiler

MDT needs to be able to locate the binary of the compiler. It uses the environment variable OPENMODELICAHOME to do so.

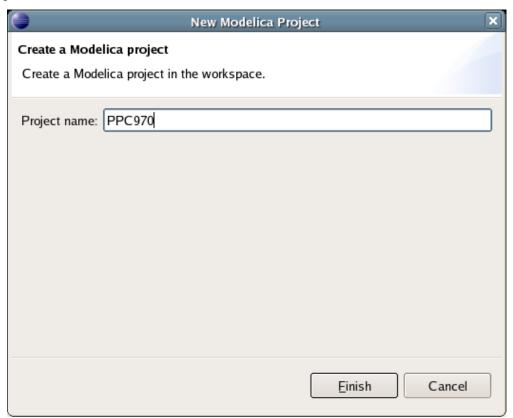

If you have problems using MDT, make sure that OPENMODELICAHOME is pointing to the folder where the Open Modelica Compiler is installed. In other words, OPENMODELICAHOME must point to the folder that contains the Open Modelica Compiler binary. On the Windows platform it's called omc.exe and on Unix platforms it's called omc.

5.3.2 Using the Modelica Perspective

The most convenient way to work with Modelica projects is to use to the Modelica perspective. To switch to the Modelica perspective, choose the **Window** menu item, pick **Open Perspective** followed by **Other...** Select the **Modelica** option from the dialog presented and click **OK**.

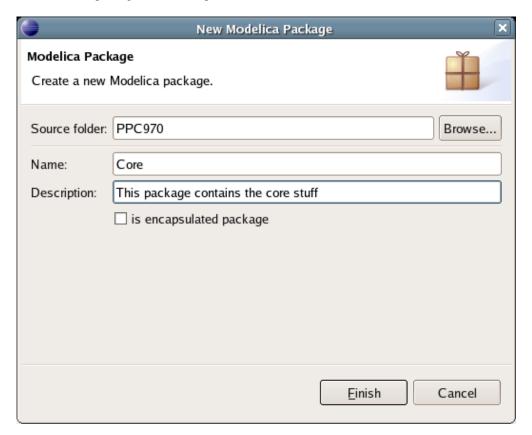

5.3.3 Creating a Project

To start a new project, use the **New Modelica Project** Wizard. It is accessible through **File -> New -> Modelica Project** or by right-clicking in the Modelica Projects view and selecting **New -> Modelica Project**.

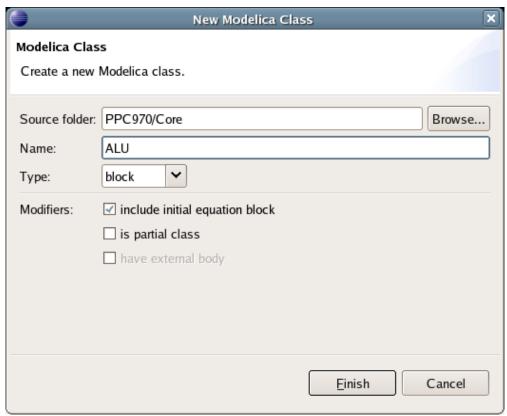

5.3.4 Creating a Package

To create a new package inside a Modelica project, select **File -> New -> Modelica Package.** Enter the desired name of the package and a description of what it contains.

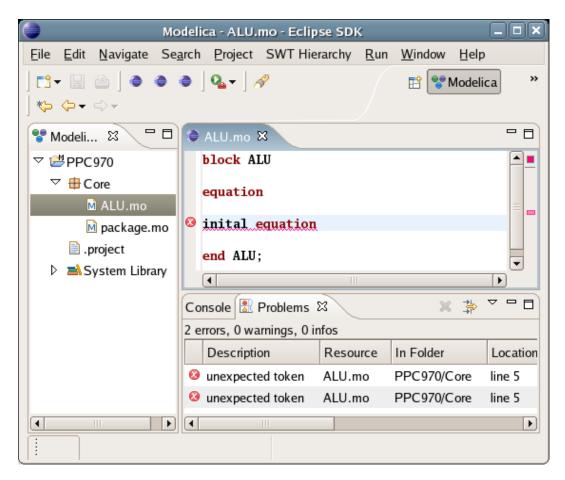

5.3.5 Creating a Class

To create a new Modelica class, select where in the hierarchy that you want to add your new class and select **File -> New -> Modelica Class**. When creating a Modelica class you can add different restrictions on what the class can contain. These can for example be model, connector, block, record, or function. When you have selected your desired class type, you can select modifiers that add code blocks to the generated code. 'Include initial code block' will for example add the line 'initial equation' to the class.

5.3.6 Syntax Checking

Whenever a Modelica (.mo) file is saved by the Modelica Editor, it is checked for syntactical errors. Any errors that are found are added to the Problems view and also marked in the source code editor. Errors are marked in the editor as a red circle with a white cross, a squiggly red line under the problematic construct, and as a red marker in the right-hand side of the editor. If you want to reach the problem, you can either click the item in the Problems view or select the red box in the right-hand side of the editor.

Chapter 6

Modelica Algorithmic Subset Debugger

This chapter presents a comprehensive Modelica debugger for an extended algorithmic subset of the Modelica language. This replaces debugging of algorithmic code using primitive means such as print statements or asserts which is complex, time-consuming and error-prone.

The debugger is portable since it is based on transparent source code instrumentation techniques that are independent of the implementation platform.

The usual debugging functionality found in debuggers for procedural or traditional object-oriented languages is supported, such as setting and removing breakpoints, single-stepping, inspecting variables, back-trace of stack contents, tracing, etc.

We presents the debugger functionality by a debugging session on a short Modelica example. The functionality of the debugger is shown using pictures from the Emacs debugging mode for Modelica (modelicadebug-mode).

Note 1: The current (June 2005) implementation of the debugger only works together with the Modelica compiler version that supports an extended algorithmic subset of Modelica, without equations and simulation, but including meta-programming support. Both compiler versions will be merged into a single version in the near future. It is not yet released for general usage.

Note 2: when applying the debugger to debug the OpenModelica compiler itself, give the make debug command to compile the code with debugging turned on, or just the command: make, to compile it without debugging support.

6.1 The Debugger Commands

The Emacs Modelica debug mode is implemented as a specialization of the Grand Unified Debugger (GUD) interface (gud-mode) from Emacs. Because the Modelica debug mode is based on the GUD interface, some of the commands have the same familiar key bindings.

The actual commands sent to the debugger are also presented together with GUD commands preceded by the Modelica debugger prompt: mdb@>.

If the debugger commands have several alternatives these are presented using the notation: $alternative1 | alternative2 | \dots$

The optional command components are presented using notation: [optional].

In the Emacs interface: M-x stands for holding down the Meta key (mapped to Alt in general) and pressing the key after the dash, here x, C-x stands for holding down the Control (Ctrl) key and pressing x, <RET> is equivalent to pressing the Enter key, and <SPC> to pressing the Space key.

6.2 Starting the Modelica Debugging Subprocess

The command for starting the Modelica debugger under Emacs is the following:

M-x modelicadebug <RET> executable <RET>

6.3 Setting/Deleting Breakpoints

A part of a session using this type of commands is shown in Figure 6-1 below. The presentation of the commands follows.

Figure 6-1. Using breakpoints.

To set a breakpoint on the line the cursor (point) is at:

```
C-x <SPC>
mdb@> break on file:lineno|string <RET>
```

To delete a breakpoint placed on the current source code line (gud-remove):

```
C-c C-d
C-x C-a C-d
mdb@> break off file:lineno|string <RET>
```

Instead of writing break one can use alternatives br | break | breakpoint.

Alternatively one can delete all breakpoints using:

```
mdb@> cl|clear <RET>
Showing all breakpoints:
  mdb@> sh|show <RET>
```

6.4 Stepping and Running

To perform one step (gud-step) in the Modelica code:

```
C-c C-s
C-x C-a C-s
mdb@> st|step <RET>
```

To continue after a step or a breakpoint (gud-cont) in the Modelica code:

```
C-c C-r
C-x C-a C-r
mdb@> ru|run <RET>
```

Examples of using these commands are presented in Figure 6-2.

Figure 6-2. Stepping and running.

6.5 Examining Data

There are no GUD keybindings for these commands but they are inspired from the GNU Project debugger (GDB).

To print the contents/size of a variable one can write:

```
mdb@> pr|print variable_name <RET>
mdb@> sz|sizeof variable_name <RET>
```

at the debugger prompt. The size is displayed in bytes.

Variable values to be printed can be of a complex type and very large. One can restrict the depth of printing using:

```
mdb@> [set] de|depth integer <RET>
```

Moreover, we have implemented an external viewer written in Java called ModelicaDataViewer to browse the contents of such a large variable. To send the contents of a variable to the external viewer for inspection one can use the command:

```
mdb@> bw|browse|gr|graph var name <RET>
```

at the debugger prompt. The debugger will try to connect to the ModelicaDataViewer and send the contents of the variable. The external data browser has to be started a priori. If the debugger cannot connect to the external viewer within a specified timeout a warning message will be displayed. A picture of the external ModelicaDataViewer tool is presented in Figure 6-3.

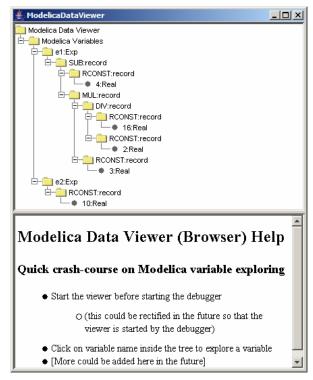

Figure 6-3. Modelica Data Viewer (Browser) for data structures, here a small abstract syntax tree.

If the variable which one tries to print does not exist in the current scope (not a live variable) a notifying warning message will be displayed.

Automatic printing of variables at every step or breakpoint can be specified by adding a variable to a display list:

```
mdb@> di|display variable_name <RET>
```

To print the entire display list:

```
mdb@> di|display <RET>
```

Removing a display variable from the display list:

```
mdb@> un|undisplay variable name <RET>
```

Removing all variables from the display list:

```
mdb@> undisplay <RET>
```

Printing the current live variables:

```
mdb@> li|live|livevars <RET>
```

Instructing the debugger to print or to disable the print of the live variable names at each step/breapoint:

```
mdb@> [set] li|live|livevars [on|off]<RET>
```

Figure 6-4 shows examples of some of these commands within a debugging session:

Figure 6-4. Examining variable values using print and display commands.

6.6 Additional commands

The stack contents (backtrace) can be displayed using:

```
mdb@> bt|backtrace <RET>
```

Because the contents of the stack can be quite large, one can print a filtered view of it:

```
mdb@> fbt|fbacktrace filter_string <RET>
```

Also, one can restrict the numbers of entries the debugger is storing using:

```
mdb@> maxbt|maxbacktrace integer <RET>
```

For displaying the status of the Modelica runtime:

```
mdb@> sts|stat|status <RET>
```

The status of the extended Modelica runtime comprises information regarding the garbage collector, allocated memory, stack usage, etc.

The current debugging settings can be displayed using:

```
mdb@> stg|settings <RET>
```

The settings printed are: the maximum remembered backtrace entries, the depth of variable printing, the current breakpoints, the live variables, the list of the display variables and the status of the runtime system.

One can invoke the debugging help by issuing:

```
mdb@> he|help <RET>
```

For leaving the debugger one can use the command:

mdb@> qu|quit|ex|exit|by|bye <RET>

A session using these commands is presented in Figure 6-5 below:

Figure 6-5. Additional debugger commands.

6.7 Hints for Debugging Large Programs

In order to faster get to an interesting place when debugging a large program such as the OpenModelica compiler itself, you can put a breakpoint at the place where you would like to start the investigation, but give the fast debug command when starting the execution from the beginning. In that case the debugger will avoid saving backtrace and variables up to this breakpoint. Then you can turn off backtrace and run the debugger as usual.

6.8 Summary of Debugger Commands

The following is a complete list of the current debugger commands

br|break|breakpoint string [on|off] Setting/unsetting breakpoints

cl|clear Clear all breakpoints

sh|show Show all breakpoints

bt|backtrace Print the backtrace (stack)

fbt|fbacktrace filter Print filtered backtrace (stack)

mb|maxbacktrace int (0=full, default=0) Set the maximum of backtrace entries (stack).

ca|callchain Print the call chain

fca|fcallchain filter Print filtered call chain

mc | maxcallchain integer Set the maximum of callchain entries. (0=full, default=100)

[set] de | depth integer Set the depth of variable printing. (0=full, default=10)

[set] ms | maxstring integer Set how may chars we print from long strings. (0=full,

default=60)

ru | run Run the program.

stg|settings Print the current settings.

he | help Showing help.

sts | stat | status Printing the status of Modelica runtime.

li | live | livevars Print the names of live variables.

[set] li|live|livevars [on|off] On/Off printing names of livevars each step.

pr|print var_name Print the live variable.

sz|size|sizeof var_name Print sizeof the live variable.

di|display var_name Display the live variable each step.

ud|undisplay var_name Un-display the live variable.

ud|undisplay

gr|graph var_name

pty|printtype identifier

Un-display ALL display variables.

Send the live variable to external viewer.

Print type info on any Modelica id.

fa|fast FAST debugging: no backtrace, callchain, livevars.

Show display variables.

qu|quit|ex|exit|by|bye Exiting the debugger/program.
